

Restricted Drug Storage

Intelligent Locking Solutions

The Problem

Authorities require strict control over storage and access to restricted drugs and poisons. Depending on the regime, these controls can include:

- storage in locked cabinets, to which the public does not have access;
- keys only held by authorised personnel;
- two authorised personnel to be present when accessing the cabinet; and
- logging of all details relating to any use of these substances.

The traditional approach has been to provide locked storage with key access with keys that are held by authorised personnel. Dispensing/usage is manually recorded in a paper log.

Common problems relate to:

- authorised personnel having to always carry keys;
- the expense and time required to re-key storage when keys are lost; and
- maintaining and reconciling the paper-based logs.

The Solution

The existing storage cabinets can be quickly and economically upgraded with an electronic locking system. Replacing the physical key locks with biometric locks removes a major source of cost and overhead – the key. The key is replaced with either one fingerprint or, for more secure requirements, a combination of fingerprint and PIN/prox card. For even more stringent control, dual access verification can be implemented.

The BioLock product provides an easy-to-implement, economical solution for medium security situations. The BioScan product with the additional features of key pad and card reader, and detailed logging provides a comprehensive solution for more demanding requirements.

The Benefits

- retain your existing investments in storage cabinets
- electronically log and report all cabinet access
- centrally maintain access rules for all authorised personnel
- eliminate replacement costs associated with lost keys
